NATURAL RESOURCES CONSERVATION SERVICE
CONSERVATION PRACTICE STANDARD

SURFACE DRAINAGE, FIELD DITCH

(ft)
CODE 607

DEFINITION

A graded ditch for collecting excess water in a field.

PURPOSE

To:

- Drain surface depressions,
- Collect or intercept excess surface water, such as sheet flow, from natural and graded land surfaces or channel flow from furrows and carry it to an outlet, and
- Collect or intercept excess subsurface water and carry it to an outlet.

CONDITIONS WHERE PRACTICE APPLIES

Applicable sites are flat or nearly flat and:

- Have soils that have low permeability or that are shallow over barriers, such as rock or clay, which hold or prevent ready percolation of water to a deep stratum.
- Have surface depressions or barriers that trap rainfall.
- Have insufficient land slope for ready movement of runoff across the surface.
- Receive excess runoff or seepage from uplands.
- Require the removal of excess irrigation water.
- Require control of the water table.
- Have adequate outlets available for disposal of drainage water by gravity flow or pumping.

CRITERIA

Drainage field ditches shall be planned as integral parts of a drainage system for the field served and shall collect and intercept water and carry it to an outlet with continuity and without ponding.

An adequate investigation shall be made of all sites.

On extensive areas of uniform topography, collection or interception ditches shall be installed as required for effective drainage.

The size, depth, side slopes, and cross section area shall:

- Be adequate to provide the required drainage for the site.
- Permit free entry of water from adjacent land surfaces without causing excessive erosion.
- Provide effective disposal or reuse of excess irrigation water (if applicable).
- Conduct flow without causing excessive erosion.
- Provide stable side slopes based on soil characteristics.
- Permit crossing by field equipment if feasible.
- Permit construction and maintenance with available equipment.

CONSIDERATIONS

Ditches should be established, insofar as topography and property boundaries permit, in straight or nearly straight courses. Random alignment may be used to follow depressions and isolated wet areas of irregular or undulating topography. Excessive cuts and the creation of small irregular fields should be avoided.

Consider effects on water budget components, especially relationships between runoff and infiltration.

The effect of changes in the water table on the rooting depth for anticipated land uses.

Downstream effects of erosion and yields of sediment and sediment-attached substances.

Effects on the salinity of the soil in the drained field.

Consider the loadings of dissolved substances downstream.

Potential changes in downstream water temperature.

Effects on wetlands or other water-related wildlife habitat.

Effects on the visual quality of downstream water courses.

PLANS SPECIFICATIONS

Plans and specifications for constructing drainage field ditches shall be in keeping with this standard and shall describe the requirements for properly installing the practice to achieve its intended purpose.

OPERATIONS AND MAINTENANCE

An operation and management plan shall be provided to and reviewed with the land manager. The plan shall be site specific and include, but not be limited to, the following: Structures will be checked and necessary maintenance, including removal of debris, shall be performed after major storms and at least semi-annually.
